

## Stat 185 - In class problems

Friday, November 3

1. McDonald's claims that a Big Mac has 560 calories. Of course, we suspect that it might be more and seek a 99% level of confidence in our suspicion. A sample of 15 Big Macs found an average of 566.88 calories with a standard deviation of 9.38.
  - (a) Write down the hypothesis test.
  - (b) Compute the test statistic.
  - (c) Use the our  $t$ -table to find the threshold  $t^*$  value for this problem.
  - (d) What is the conclusion of the test?
  - (e) Find the corresponding  $p$ -value.
  - (f) Does this confirm the conclusion of the test?
2. Suppose we wish to estimate the average height of NC college students. We'd like a 99% confidence interval with a margin of error half an inch. Pilot studies indicate that the standard deviation in random samples is approximately 2.3 inches. How large a sample size do we need?

## *t*-tables

	one tail	0.100	0.050	0.025	0.010	0.005
	two tails	0.200	0.100	0.050	0.020	0.010
df	1	3.08	6.31	12.71	31.82	63.66
	2	1.89	2.92	4.30	6.96	9.92
	3	1.64	2.35	3.18	4.54	5.84
	4	1.53	2.13	2.78	3.75	4.60
	5	1.48	2.02	2.57	3.36	4.03
	6	1.44	1.94	2.45	3.14	3.71
	7	1.41	1.89	2.36	3.00	3.50
	8	1.40	1.86	2.31	2.90	3.36
	9	1.38	1.83	2.26	2.82	3.25
	10	1.37	1.81	2.23	2.76	3.17
	11	1.36	1.80	2.20	2.72	3.11
	12	1.36	1.78	2.18	2.68	3.05
	13	1.35	1.77	2.16	2.65	3.01
